

Indexer and Persister Config Versioning and Baselining

Overview

Indexer Service and Persister service now support version handling and are baselined at version 1.0.0. Whenever the aforementioned services consume any indexing request, they check the version present in the incoming request, if a version is present in the incoming request, the services fetch the applicable service map for that from the config file and proceeds to index the incoming request. On the other hand, if version in incoming request is absent or null, the services fall back to pick up the service mapping corresponding to default base version i.e. 1.0.0.

Release Highlights

- Version handling now introduced in indexer and persister service and it is baselined at version 1.0.0.
